UCX
Unified Communication - X Framework
Presented by Yossi Itigin
UCX Framework Mission

• Collaboration between industry, laboratories, and academia

• To create open-source production grade communication framework for data centric and HPC applications

• To enable the highest performance through co-design of software-hardware interfaces
## Background

### MXM
- Developed by Mellanox Technologies
- HPC communication library for InfiniBand devices and shared memory
- Primary focus: MPI, PGAS

### UCCS
- Developed by ORNL, UH, UTK
- Originally based on Open MPI BTL and OPAL layers
- HPC communication library for InfiniBand, Cray Gemini/Aries, and shared memory
- Primary focus: OpenSHMEM, PGAS
- Also supports: MPI

### PAMI
- Developed by IBM on BG/Q, PERCS, IB VERBS
- Network devices and shared memory
- MPI, OpenSHMEM, PGAS, CHARM++, X10
- C++ components
- Aggressive multi-threading with contexts
- Active Messages
- Non-blocking collectives with hw acceleration support

---

**UCX is an Integration of Industry and Users Design Efforts**
## UCX Goals

<table>

### Co-design of Exascale Network APIs
Members

Mellanox co-designs network interface and contributes MXM technology
  ○ Infrastructure, UD, RC, DCT, shared memory, protocols, integration with OpenMPI/SHMEM, MPICH

ORNL co-designs network interface and contributes UCCS project
  ○ IB optimizations, support for Cray devices, shared memory

NVIDIA co-designs high-quality support for GPU devices
  ○ GPU-Direct, GDR copy, etc.

IBM co-designs network interface and contributes ideas and concepts from PAMI

UH/UTK focus on integration with their research platforms
What’s new about UCX?

- Simple and consistent API
- Choosing between low-level and high-level API allows easy integration with a wide range of applications and middleware.
- Protocols and transports are selected by capabilities and performance estimations, rather than hard-coded definitions.
- Support thread contexts and dedicated resources, as well as fine-grained and coarse-grained locking.
- Accelerators are represented as a transport, driven by a generic “glue” layer, which will work with all communication networks.
The UCX Framework

**UC-S for Services**
This framework provides basic infrastructure for component based programming, memory management, and useful system utilities.

**Functionality:**
Platform abstractions, data structures, debug facilities.

---

**UC-T for Transport**
Low-level API that expose basic network operations supported by underlying hardware. Reliable, out-of-order delivery.

**Functionality:**
Setup and instantiation of communication operations.

---

**UC-P for Protocols**
High-level API uses UCT framework to construct protocols commonly found in applications.

**Functionality:**
Multi-rail, device selection, pending queue, rendezvous, tag-matching, software-atomics, etc.
High-level Overview

**UC-T (Hardware Transports) - Low Level API**
- RMA, Atomic, Tag-matching, Send/Recv, Active Message
- Transport for InfiniBand VERBs
- RC, UD, XRC, DCT
- Transport for Gemini/Aries drivers
- GNI
- Transport for intra-node host memory communication
- SYSV, POSIX, KNEM, CMA, XPMEM

**UC-P (Protocols) - High Level API**
- Transport selection, cross-transport multi-rail, fragmentation, operations not supported by hardware
- Message Passing API Domain: tag matching, rendezvous
- PGAS API Domain: RMAs, Atomics
- Task Based API Domain: Active Messages
- I/O API Domain: Stream

**UC-S (Services)**
- Common utilities
- Utilities
- Data structures
- Memory Management

**Applications**
- MPICH, Open-MPI, etc.
- OpenSHMEM, UPC, CAF, X10, Chapel, etc.
- Parsec, OCR, Legions, etc.
- Burst buffer, ADIOS, etc.

**Hardware**
- OFA Verbs Driver
- Cray Driver
- OS Kernel
- Cuda
Clarifications

• UCX is not a device driver

• UCX is a framework for communications
  Close-to-hardware API layer
  Providing an access to hardware’s capabilities

• UCX relies on drivers supplied by vendors
Project Management

- API definitions and changes are discussed within developers (mail-list, github, conf call)
- PRs with API change have to be approved by ALL maintainers
- PR within maintainer “domain” has to be reviewed by the maintainer or team member (Example: Mellanox reviews all IB changes)
Licensing

- BSD 3 Clause license
- Contributor License Agreement – BSD 3 based
UCX Advisory Board

- Arthur Barney Maccabe (ORNL)
- Bronis R. de Supinski (LLNL)
- Donald Becker (NVIDIA)
- George Bosilca (UTK)
- Pavan Balaji (ANL)
- Richard Graham (Mellanox Technologies)
- Sameer Kumar (IBM)
- Stephen Poole (Open Source Software Solutions)
- Gilad Shainer (Mellanox Technologies)
- Sameh Sharkawi (IBM)
API Overview
UCT (Transport layer) objects

- `uct_worker_h`
  A context for separate progress engine and communication resources. Can be either thread-dedicated or shared.

- `uct_pd_h` (will be renamed to `uct_md_h`)
  Memory registration domain. Can register user buffers and allocate registered memory.

- `uct_iface_h`
  Communication interface, created on a specific memory domain and worker. Handles incoming active messages and spawns connections to remote interfaces.

- `uct_ep_h`
  Connection to a remote interface. Used to initiate communications.

- `uct_mem_h`
  Registered memory handle.

- `uct_rkey_t`
  Remote memory access key.
UCT initialization

Entity A
- Memory Domain
- Worker
- Interface
- Endpoint
- Connect

Entity B
- Memory Domain
- Worker
- Interface
- Endpoint
- Connect

Out-of-band Address Exchange
UCT memory primitives

- Register memory within the domain
  - Can potentially use a cache to speedup registration

- Allocate registered memory.

- Pack memory region handle to a remote-key-buffer
  - Can be sent to another entity.

- Unpack a remote-key-buffer into a remote-key
  - Can be used for remote memory access.
UCT communication primitives

- Not everything has to be supported.
  - Interface reports the set of supported primitives.
  - UCP uses this info to construct protocols.
- Send active message (active message id)
- Put data to remote memory (virtual address, remote key)
- Get data from remote memory (virtual address, remote key)
- Perform an atomic operation on remote memory:
  - Add
  - Fetch-and-add
  - Swap
  - Compare-and-swap
- Insert a fence
- Flush pending communications
UCT data

- UCT communications have a size limit
  - Interface reports max. allowed size for every operation.
  - Fragmentation, if required, should be handled by user / UCP.

- Several data “classes” are supported:
  - “short” – small buffer.
  - “bcopy” – a user callback which generates data (in many cases, “memcpy” can be used as the callback).
  - “zcopy” – a buffer and it’s memory region handle. Usually large buffers are supported.

- Atomic operations use a 32 or 64 bit immediate values.
UCT completion semantics

- All operations are non-blocking
- Return value indicates the status:
  - OK – operation is completed.
  - INPROGRESS – operation has started, but not completed yet.
  - NO_RESOURCE – cannot initiate the operation right now. The user might want to put this on a pending queue, or retry in a tight loop.
  - ERR_xx – other errors.
- Operations which may return INPROGRESS (get/atomics/zcopy) can get a completion handle.
  - User initializes the completion handle with a counter and a callback.
  - Each completion decrements the counter by 1, when it reaches 0 – the callback is called.
typedef ucs_status_t (*uct_am_callback_t)(void *arg, void *data, size_t length,
    void *desc);

typedef void (*uct_pack_callback_t)(void *dest, void *arg, size_t length);

typedef void (*uct_completion_callback_t)(uct_completion_t *self);

typedef struct uct_completion uct_completion_t;
struct uct_completion {
    uct_completion_callback_t func;
    int count;
};

typedef uintptr_t uct_rkey_t;

typedef void * uct_mem_h;

ucs_status_t uct_ep_put_short(uct_ep_h ep, const void *buffer, unsigned length,
    uint64_t remote_addr, uct_rkey_t rkey);

cscmp

ucs_status_t uct_ep_put_bcopy(uct_ep_h ep, uct_pack_callback_t pack_cb,
    void *arg, size_t length, uint64_t remote_addr,
    uct_rkey_t rkey);

cscmp

ucs_status_t uct_ep_put_zcopy(uct_ep_h ep, const void *buffer, size_t length,
    uct_mem_h memh, uint64_t remote_addr,
    uct_rkey_t rkey, uct_completion_t *comp);

cscmp

ucs_status_t uct_ep_am_short(uct_ep_h ep, uint8_t id, uint64_t header,
    const void *payload, unsigned length);

cscmp

ucs_status_t uct_ep_atomic_cswap64(uct_ep_h ep, uint64_t compare, uint64_t swap,
    uint64_t remote_addr, uct_rkey_t rkey,
    uint64_t *result, uct_completion_t *comp);

cscmp
Currently supported transports

- Shared memory
  - SystemV
  - CMA
  - KNEM
- uGNI (RMA API and ATOMICS)
- IB
  - RC
  - UD (still WIP)
  - CM (for wireup only)
UCP (protocol layer)

- Mix-and-match transports, devices, and operations, for optimal performance.
  - Based on UCT capabilities and performance estimations.

- Enforce ordering when required (e.g. tag matching)

- Work around UCT limitations:
  - Fragmentation
  - Emulate unsupported operations
  - Expose one-sided connection establishment
UCP objects

- **ucp_context_h**
  A global context for the application. For example, hybrid MPI/SHMEM library may create one context for MPI, and another for SHMEM.

- **ucp_worker_h**
  Communication resources and progress engine context. One possible usage is to create one worker per thread. Contains the uct_iface_h’s of all selected transports.

- **ucp_ep_h**
  Connection to a remote worker. Used to initiate communications. Contains the uct_ep_h’s of currently active transports.

- **ucp_mem_h**
  Handle to memory allocated or registered in the local process. Contains an array of uct_mem_h’s for currently active transports.

- **ucp_rkey_h**
  Remote key handle, contains an array of uct_rkey_t’s.
UCP initialization

Entity A
- Context
- Worker
- Endpoint

Entity B
- Context
- Worker

Out-of-band Address Exchange
UCP communications

- Tag-matched send/receive
  - Blocking / Non-blocking
  - Standard / Synchronous / Buffered

- Remote memory operations
  - Blocking put, get, atomics
  - Non-blocking – TBD

- Data is specified as buffer and length
  - No size limit
  - May register the buffer and use zero copy
UCP API

typedef uint64_t ucp_tag_t;

ucs_status_t ucp_worker_create(ucp_context_h context, ucs_thread_mode_t thread_mode,
                                ucp_worker_h *worker_p);

ucs_status_t ucp_worker_get_address(ucp_worker_h worker, ucp_address_t **address_p,
                                     size_t *address_length_p);

ucs_status_t ucp_ep_create(ucp_worker_h worker, ucp_address_t *address,
                            ucp_ep_h *ep_p);

ucs_status_t ucp_put(ucp_ep_h ep, const void *buffer, size_t length,
                      uint64_t remote_addr, ucp_rkey_h rkey);

ucs_status_t ucp_get(ucp_ep_h ep, void *buffer, size_t length,
                      uint64_t remote_addr, ucp_rkey_h rkey);
